Other commonly used names are: Etodolic acid, Indometacin, Meclofenamic acid.

This information does *not* apply to aspirin or other salicylates or to ketorolac (e.g., Toradol).

Description

[Back to top](#)

Nonsteroidal anti-inflammatory drugs (also called NSAIDs) are used to relieve some symptoms caused by arthritis (rheumatism), such as inflammation, swelling, stiffness, and joint pain. However, this medicine does not cure arthritis and will help you only as long as you continue to take it.

Some of these medicines are also used to relieve other kinds of pain or to treat other painful conditions, such as:

- gout attacks;
- bursitis;
- tendinitis;
- sprains, strains, or other injuries; or
- menstrual cramps.

Ibuprofen and naproxen are also used to reduce fever.

Meclofenamate is also used to reduce the amount of bleeding in some women who have very heavy menstrual periods.

Nonsteroidal anti-inflammatory drugs may also be used to treat other conditions as determined by your doctor.

Another commonly used name for indomethacin is indometacin .

Description[Back to top](#)

Ophthalmic anti-inflammatory medicines are used in the eye to lessen problems that can occur during or after some kinds of eye surgery. Sometimes, the pupil of the eye gets smaller during an operation. This makes it more difficult for the surgeon to reach some areas of the eye. Some of these medicines are used to help prevent this. Also, some of them are used after eye surgery, to relieve effects such as inflammation or edema (too much fluid in the eye).

These medicines may also be used for other conditions, as determined by your ophthalmologist (eye doctor).

These medicines are available only with your doctor's prescription, in the following dosage forms:

Ophthalmic

- Diclofenac
 - Ophthalmic solution (U.S. and Canada)
- Flurbiprofen
 - Ophthalmic solution (U.S. and Canada)
- Indomethacin
 - Ophthalmic suspension (Canada)
- Suprofen
 - Ophthalmic solution (U.S.)

Before Using This Medicine[Back to top](#)

In deciding to use a medicine, the risks of taking the medicine must be weighed against the good it will do. This is a decision you and your doctor will make. For ophthalmic anti-inflammatory medicines, the following should be considered:
